

IN THE CLAIMS

1 (Currently Amended). An integrated memory system, comprising;
a non-volatile solid-state memory; ~~and~~
an automatic storage error corrector including functionally independent devices,
each device to correct a different predetermined storage error of data stored in the memory, at least
one of said devices being external to the memory[.]]; and
a circuit, in said memory, to request external correction of an error.

2 (Previously Presented). A system according to claim 1, wherein said memory is
connected to a controller by means of an interface bus and said devices are incorporated both in the
memory and in the controller.

3 (Previously Presented). A system according to claim 1, including coding circuits to
correct two errors, a logic to calculate a syndrome, a single error correcting circuit, and a logic to
detect more than one error.

4 (Previously Presented). A system according to claim 3, further including a logic to
supply the controller with a one-or-no-error-corrected data, the uncorrected error, and the
calculated syndrome.

5 (Currently Amended). A system according to claim 2, ~~including a circuit to generate
a signal to request the external correction of an error~~ said circuit to generate a signal to request
correction by said controller.

6 (Previously Presented). A system according to claim 3, wherein said coding circuits
are located immediately downstream of the input terminal of said memory to perform a vector
product proportional to the number of parity bits and obtained through the synthesis of a
corresponding logic function.

7 (Previously Presented). A system according to claim 6, wherein said logic to calculate the syndrome to use a parity calculation circuit of the coding circuits.

8 (Previously Presented). A system according to claim 3, wherein said single error correcting circuit for an error comprises a block to decode a single error effective to recognize each of the several syndromes associated to a single error to activate, through a corresponding vector, the correction of the corresponding bit.

9 (Currently Amended). A system, comprising:
a first circuit operable to store data in a non-volatile solid-state memory, the data having associated therewith at least one storage error of a plurality of storage-error types, the first circuit operable to correct a first-type error of the plurality of storage-error types; and
a second circuit coupled to the first circuit, the second circuit operable to correct a second-type error of the plurality of storage-error types[.]; and
a third circuit coupled to one of said first or second circuits to request correction of an error externally to said memory.

10 (Previously Presented). The system of claim 9 wherein the second circuit to generate a signal requesting correction of a third-type error of the plurality of storage-error types.

11 (Previously Presented). The system of claim 9 wherein the first circuit further to determine at least one syndrome associated with the at least one storage error.

12 (Previously Presented). The system of claim 9 wherein the first circuit further to detect the second-type error.

13 (Previously Presented). The system of claim 9 wherein the second circuit to correct the second-type error in response to a signal generated by the first circuit.

14 (Original). The system of claim 9 wherein the first circuit comprises a non-volatile memory.

15 (Original). The system of claim 9 wherein:

the first circuit is disposed on a first integrated circuit; and
the second circuit is disposed on a second integrated circuit.

16 (Original). The system of claim 9 wherein the first and second circuits are disposed on an integrated circuit.

17 (Currently Amended). A memory device, comprising:

a non-volatile solid-state storage portion to store data having associated therewith at least one storage error of a plurality of storage-error types;

a first circuit to correct a first-type error of the plurality of storage-error types; and

a second circuit to generate a signal indicating detection of a second-type error of the plurality of storage-error types[.]; and

a third circuit coupled to one of said first or second circuits to request correction of an error externally to said storage portion.

18 (Previously Presented). The device of claim 17, further comprising a third circuit to determine at least one syndrome associated with the at least one storage error.

19 (Previously Presented). A method, comprising:

storing, in a non-volatile solid-state memory location of a device, data having associated therewith at least one storage error of a plurality of storage-error types; and

correcting, at the memory location, a first-type error of the plurality of storage-error types.

20 (Original). The method of claim 19, further comprising generating, at the memory location, an interrupt-request signal indicating detection of a second-type error of the plurality of storage-error types.

21 (Previously Presented). An electronic system, comprising:

a first integrated circuit having a non-volatile solid-state memory to store data having associated therewith at least one storage error of a plurality of storage-error types, the memory to correct a first-type error of the plurality of storage-error types; and

a second integrated circuit coupled to the first circuit, the second integrated circuit having processor to correct a second-type error of the plurality of storage-error types.
